1. **How to install the software of AIO3315**

1.1 Install the PCI driver

The PCI card is a plug and play card, once you add on a new card, the window system will detect while it is booting. Please follow the following steps to install your new card.

In Windows 2000/XP/Vista system you should:

1. Make sure the power is off
2. Plug in the interface card
3. Power on
4. A hardware install wizard will appear and tell you it finds a new PCI card
5. Do not response to the wizard, just Install the file
 \AIO3315\Software\Win2K_up\AIO3315_Install.exe
6. After installation, power off
7. Power on, it's ready to use

For more detail of step by step installation guide, please refer the file "installation.pdf" on the CD come with the product or register as a member of our user's club at:

<http://automation.com.tw/>

to download the complementary documents.

2. **Where to find the file you need**

Windows2000,XP,Vista

In Windows 2000,XP,Vista system, the demo program can be setup by

\AIO3315\software\Win2K_up\install\AIO3315_Install.exe

The directory will be located at

.. \JS Automation\AIO3315\API\ (header files and VB,VC lib files)

.. \JS Automation\AIO3315\Driver\ (backup copy of AIO3315 drivers)

.. \JS Automation\AIO3315\exe\ (demo program and source code)

The system driver is located at **../system32/Drivers** and the DLL is located at **../system.**

3. About the AIO3315 software

AIO3315 software includes a set of dynamic link library (DLL) and system driver that you can utilize to control the I/O card's ports and points separately.

Your AIO3315 software package includes setup driver, tutorial example and test program that help you how to setup and run appropriately, as well as an executable file which you can use to test each of the AIO3315 functions within Windows' operation system environment.

3.1 What you need to get started

To set up and use your AIO3315 software, you need the following:

- AIO3315 software
- AIO3315 hardware
 - Main board
 - Wiring board (Option)

3.2 Software programming choices

You have several options to choose from when you are programming AIO3315 software. You can use Borland C/C++, Microsoft Visual C/C++, Microsoft Visual Basic, or any other Windows-based compiler that can call into Windows dynamic link libraries (DLLs) for use with the AIO3315 software.

4. **AIO3315 Language support**

The AIO3315 software library is a DLL used with Windows 2000,XP,Vista You can use these DLL with any Windows integrating development environment that can call Windows DLLs.

4.1 Building applications with the AIO3315 software library

The AIO3315 function reference topic contains general information about building AIO3315 applications, describes the nature of the AIO3315 files used in building AIO3315 applications, and explains the basics of making applications using the following tools:

Applications tools

- ◆ **Borland C/C++**
- ◆ **Microsoft Visual C/C++**
- ◆ **Microsoft Visual Basic**

If you are not using one of the tools listed, consult your development tool reference manual for details on creating applications that call DLLs.

4.2 AIO3315 Windows libraries

The AIO3315 for Windows function library is a DLL called **AIO3315.dll**. Since a DLL is used, AIO3315 functions are not linked into the executable files of applications. Only the information about the AIO3315 functions in the AIO3315 import libraries is stored in the executable files. Import libraries contain information about their DLL-exported functions. They indicate the presence and location of the DLL routines. Depending on the development tools you are using, you can make your compiler and linker aware of the DLL functions through import libraries or through function declarations.

Refer to **Table 1** to determine to which files you need to link and which to include in your development to use the AIO3315 functions in AIO3315.dll.

Header Files and Import Libraries for Different Development Environments		
Development Environment	Header File	Import Library
Microsoft C/C++	AIO3315.h	AIO3315VC.lib
Borland C/C++	AIO3315.h	AIO3315BC.lib
Microsoft Visual Basic	AIO3315.bas	

Table 1

5. Basic concepts of analog I/O control

Analog input is used for quantizing the real world signals to digital value and analog output is vice versa for converting digital values to real world analog values.

Types of analog input

We can classify the input by type as: current type, voltage type. But you can easily convert the current to voltage by insert a resistor. Generally, voltage type analog input can satisfy most applications.

On the other hand, the input type can also classify by the detection method. Single end input detects the input voltage by reference to a common point and differential input detects input voltage to the difference of the input.

Single end type

Differential type

From the above diagram, you can see the differential type must have a common connection between measured signal and the AD converter. The under measure voltage is riding on a common voltage V_c . The AIO3315 card can measure the analog voltage without damage at V_c under $-10V \sim +10V$. Out of this common voltage range, the conversion maybe error or the on board chip will be damaged.

The AIO3315 has 12 bit resolution and can accept $0 \sim 5V$, $0 \sim 10V$, $-5V \sim +5V$ and $-10V \sim +10V$ range. The adjacent channel can be programmed as differential or leave it as single end input.

Types of analog output

There are current type and voltage type in general. Current type mostly use $0 \sim 20mA$ or $4 \sim 20mA$ for remote analog signal transmission. Voltage type is the major on the market.

AIO3315 provide voltage type output and 12 bit resolution maps to $-10V \sim +10V$ range.

6. Basic concepts of digital I/O control

The digital I/O control is the most common type of PC based application. For example, on the main board, printer port is the TTL level digital I/O.

Types of I/O classified by isolation

If the system and I/O are not electrically connected, we call it is isolated. There are many kinds of isolation: by transformer, by photo-coupler, by magnetic coupler,... Any kind of device, they can brake the electrical connection without braking the signal is suitable for the purpose.

Currently, photo-coupler isolation is the most popular selection, isolation voltage up to 2000V or over is common. But the photo-coupler is limited by the response time, the high frequency type cost a lot. The new selection is magnetic coupler, it is design to focus on high speed application.

The merit of isolation is to avoid the noise from outside world to enter the PC system, if the noise comes into PC system without elimination, the system maybe get “crazy” by the noise disturbance. Of course the isolation also limits the versatile of programming as input or output at the same pin as the TTL does. The inter-connection of add-on card and wiring board maybe extend to several meters without any problem.

The non-isolated type is generally the TTL level input/output. The ground and power source of the input/output port come from the system. Generally you can program as input or output at the same pin as you wish. **The connection of wiring board and the add-on board is limited to 50cm or shorter** (depends on the environmental noise condition).

Types of Output calssified by driver device

There are several devices used as output driver, the relay, transistor or MOS FET, SCR and SSR. Relay is electric- mechanical device, it life time is about 1,000,000 times of switching. But on the other hand it has many selections such as high voltage or high current. It can also be used to switch DC load or AC load.

Transistor and MOS FET are basically semi-permanent devices. If you have selected the right ratings, it can work without switching life limit. But the transistor or MOS FET can only work in DC load condition.

The transistor or MOS FET also have another option is source or sink. For PMOS or PNP transistor is source type device, the load is one terminal connects to output and another connects to common ground, but NPN or NMOS is one terminal connects to output and the other connects to VCC+. **If you are concerned about hazard from high DC voltage while the load is floating, please choose the source type driver device.**

SCR (or triac) is seldom direct connect to digital output, but his relative SSR is the most often selection. In fact, SSR is a compact package of trigger circuit and triac. You can choose zero cross trigger (output command only turn on the output at power phase near zero to eliminate surge) or direct turn on type. SSR is working in AC load condition.

Input debounce

Debounce is the function to filter the input jitters. From the microscope view of a switch input, you will see the contact does not come to close or release to open clearly. In most cases, it will contact-release-contact-release... for many times then go to steady state (ON or OFF). If you do not have the debounce function, you will read the input at high state and then next read will get low state, this maybe an error data for your decision of contact input.

Debounce can be implemented by hardware or software. Analog hardware debounce circuit will have fixed time constant to filter out the significant input signal, if you want to change the response time, the only way is to change the circuit device.

If digital debounce is implemented, maybe several filter frequency you can choose. To choose the filter frequency, please keep the Nyquist–Shannon sampling theorem in mind: filter sample frequency must at least twice of the input frequency. The following sample is a bad selection of debounce filter, the input frequency is not as low as less than half of the sample frequency, the output will generate a beat frequency.

Software debounce will consumes the CPU time a lot, we do not recommend to use except for you really know you want.

Input interrupt

You can scan the input by polling, but the CPU will spend a lot of time to do null task. Another way is use a timer to sample the input at adequate time (remind the Nyquist–Shannon sampling theorem, at least double of the input frequency). The third one is directly allows the input to generate interrupt to CPU. To use direct interrupt from input, the noise coupled from input must take special care not to mal-trigger the interrupt.

Read back of Output status

Some applications need to read back the output status, if the card do not provide output status read back, you can use a variable to store the status of output before you really command it output. Some cards provide the read back function but please note that **the read back status is come from the output register, not from the real physical output.**

7. Software overview

These topics describe the features and functionality of the AIO3315 boards and briefly describes its functions.

7.1 Initialization and close

You need to initialize system resource each time you run your application.

[*AIO3315 initial\(\)*](#) will do.

Once you want to close your application, call

[*AIO3315 close\(\)*](#) to release all the resource.

If you want to know the physical address assigned by OS. Use

[*AIO3315 info\(\)*](#) to get the address and CardType

7.2 DA (Digital to analog) function

The digital to analog conversion function is implemented by hardware, to output analog voltage just use:

[*AIO3315 DA set\(\)*](#), and you can also read back the settings by

[*AIO3315 DA read\(\)*](#).

7.3 AD (Analog to digital) function

The analog input maybe single end or differential, you can configure individual channel as single end input or the corresponding pair as differential input by:

[*AIO3315 AD config set\(\)*](#) and read back to verify the configuration setting by

[*AIO3315 AD config read\(\)*](#).

The analog inputs maybe at different voltage range, you can configure the adequate input range to fit the inputs by:

[*AIO3315 AD range set\(\)*](#) and read back to verify the settings by:

[*AIO3315 AD range read\(\)*](#)

Once the input type and input range has been set, you can start AD conversion by:

[*AIO3315 AD start \(\)*](#) and read the conversion data by

[*AIO3315 AD read\(\)*](#).

7.4 I/O Port R/W

Before using a IO port, you must configure the port direction (as input or as output) first by

[*AIO3315 port config set\(\)*](#) and any time you can read back configuration by

[*AIO3315 port config read\(\)*](#)

Mechanical contact or noisy environment always induced unstable state at digital inputs, the AIO3315 provides software selectable debounce function (the former digital IO cards use hardware debounce and fixed at one frequency). You can filter out the pulse width at 10ms (100Hz), 5ms (200Hz), 1ms (1KHz) or no filter as you need.

Use

[*AIO3315 debounce time set\(\)*](#) to select the debounce frequency and read back the setting by [*AIO3315 debounce tme read\(\)*](#).

Then you can use the following functions for I/O port output, data reading and control:

[*AIO3315 port set\(\)*](#) to output byte data to output port,

[*AIO3315 port read\(\)*](#) to read a byte data from I/O port,

[*AIO3315 point set\(\)*](#) to set output bit,

[*AIO3315 point read\(\)*](#) to read I/O bit,

7.5 Timer function

There is a build in 32 bit timer run on 1us time base, you can set the timer constant by

[*AIO3315 timer set\(\)*](#) and

[*AIO3315 timer read\(\)*](#) to read timer value on the fly.

[*AIO3315 timer start\(\)*](#) to star its operation,

[*AIO3315 timer stop\(\)*](#) to stop operation.

For the timer related registers use:

[*AIO3315 TC set\(\)*](#) to set registers,

[*AIO3315 TC read\(\)*](#) to read back registers.

7.6 Interrupt function

Sometimes you want your application to take care of the I/O while special event occurs, interrupt function is the right choice. AIO3315 provide IO00 ~ IO07 as external event trigger input. You may configure the trigger polarity by:

[*AIO3315 IRO polarity set\(\)*](#) and read back by

[*AIO3315 IRO polarity read\(\)*](#)

For timer ans digital IO interrupts, you can mask off the source you don' want by

[*AIO3315 IRO mask set\(\)*](#) and read back by

[*AIO3315 IRO mask read\(\)*](#).

After all the above is prepared, you must first link your service routine to the driver by

[*AIO3315 IRO process link\(\)*](#)

Now all is ready, you can enable the interrupt by

[*AIO3315 IRO enable\(\)*](#) or disable by

[*AIO3315 IRO disable\(\)*](#).

To read back the interrupt status (at interrupt service routine or polling routine) use

[*AIO3315 IRO status read\(\)*](#).

After reading the status register on card will be cleared.

7.7 Error conditions

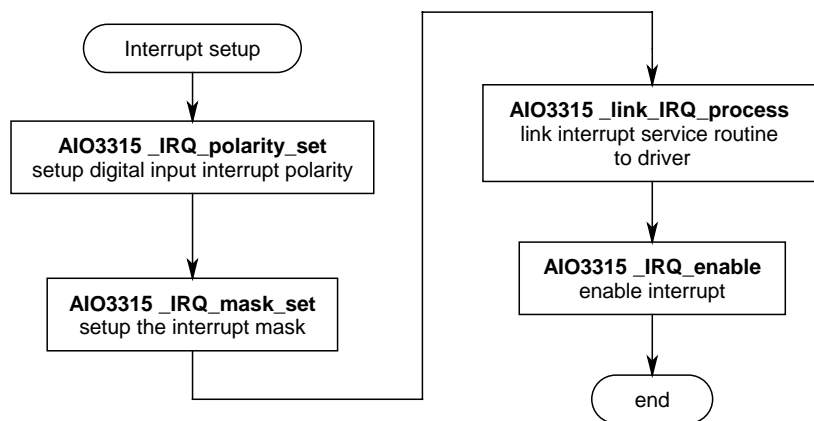

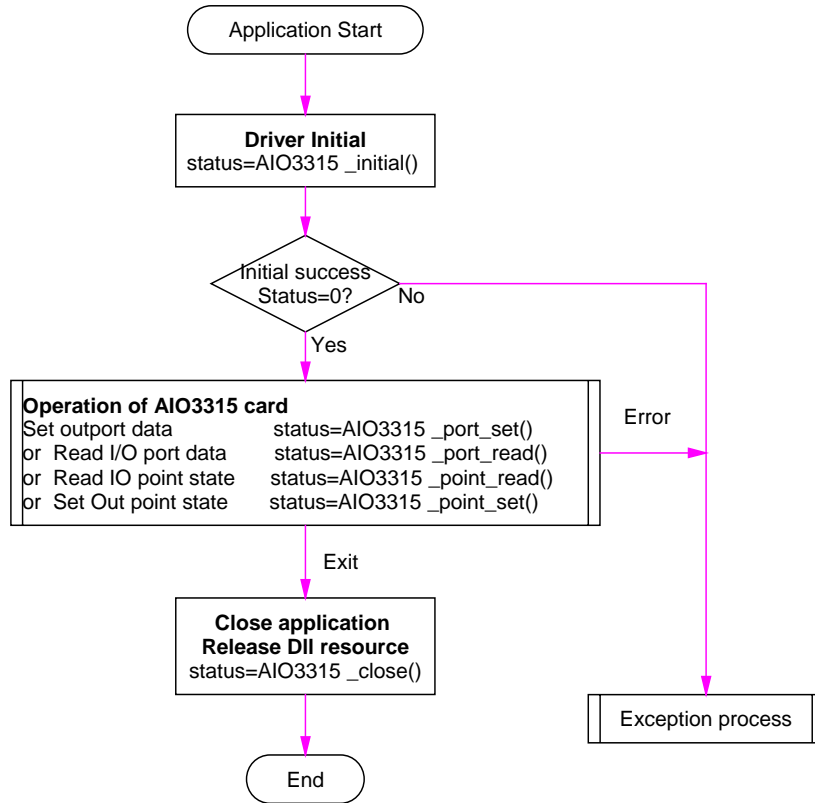

AIO3315 cards minimize error conditions. There are three possible fatal failure modes:

- ◆ System Fail Status Bit Valid
- ◆ Communication Loss
- ◆ Hardware not ready

These error types may indicate an internal hardware problem on the board. Error Codes contains a detailed listing of the error status returned by AIO3315 functions.

8. Flow chart of implement an application

8.1 AIO3315 Flow chart of implementation

9. **Function reference**

9.1 Function format

Every AIO3315 function is consist of the following format:

Status = function_name (parameter 1, parameter 2, ... parameter n);

Each function returns a value in the **Status** global variable that indicates the success or failure of the function. A returned **Status** equal to zero that indicates the function executed successfully. A non-zero status indicates failure that the function did not execute successfully because of an error, or executed with an error.

Note: **Status** is a 32-bit unsigned integer.

The first parameter to almost every AIO3315 function is the parameter **CardID** which is located the driver of AIO3315 board you want to use those given operation. The **CardID** is assigned by DIP/ROTARY SW. You can utilize multiple devices with different card CardID within one application; to do so, simply pass the appropriate **CardID** to each function.

Note: **CardID** is set by DIP/ROTARY SW (**0x0-0xF**)

These topics contain detailed descriptions of each AIO3315 function. The functions are arranged alphabetically by function name. Refer to AIO3315 Function Reference for additional information.

9.2 Variable data types

Every function description has a parameter table that lists the data types for each parameter. The following sections describe the notation used in those parameter tables and throughout the manual for variable data types.

Primary Type Names					
Name	Description	Range	C/C++	Visual BASIC	Pascal (Borland Delphi)
u8	8-bit ASCII character	0 to 255	char	Not supported by BASIC. For functions that require character arrays, use string types instead.	Byte
I16	16-bit signed integer	-32,768 to 32,767	short	Integer (for example: deviceNum%)	SmallInt
U16	16-bit unsigned integer	0 to 65,535	unsigned short for 32-bit compilers	Not supported by BASIC. For functions that require unsigned integers, use the signed integer type instead. See the i16 description.	Word
I32	32-bit signed integer	-2,147,483,648 to 2,147,483,647	long	Long (for example: count&)	LongInt
U32	32-bit unsigned integer	0 to 4,294,967,295	unsigned long	Not supported by BASIC. For functions that require unsigned long integers, use the signed long integer type instead. See the i32 description.	Cardinal (in 32-bit operating systems). Refer to the i32 description.
F32	32-bit single-precision floating-point value	-3.402823E+38 to 3.402823E+38	float	Single (for example: num!)	Single
F64	64-bit double-precision floating-point value	-1.797683134862315E+308 to 1.797683134862315E+308	double	Double (for example: voltage Number)	Double

Table 2

9.3 Programming language considerations

Apart from the data type differences, there are a few language-dependent considerations you need to be aware of when you use the AIO3315 API. Read the following sections that apply to your programming language.

Note: Be sure to include the declaration functions of AIO3315 prototypes by including the appropriate AIO3315 header file in your source code. Refer to Building Applications with the AIO3315 Software Library for the header file appropriate to your compiler.

9.3.1 C/C++

For C or C++ programmers, parameters listed as Input/Output parameters or Output parameters are pass-by-reference parameters, which means a pointer points to the destination variable should be passed into the function. For example, the Read Port function has the following format:

```
Status = AIO3315_port_read (u8 CardID, u8 port, u8*data);
```

where **CardID** and **port** are input parameters, and **data** is an output parameter. Consider the following example:

```
u8 CardID, port;  
u8 data,  
u32 Status;  
Status = AIO3315_port_read (CardID, port, &data);
```

9.3.2 Visual basic

The file AIO3315.bas contains definitions for constants required for obtaining DIO Card information and declared functions and variable as global variables. You should use these constants symbols in the AIO3315.bas, do not use the numerical values.

In Visual Basic, you can add the entire AIO3315.bas file into your project. Then you can use any of the constants defined in this file and call these constants in any module of your program. To add the AIO3315.bas file for your project in Visual Basic 4.0, go to the **File** menu and select the **Add File...** option. Select AIO3315.bas, which is browsed in the AIO3315 \ api directory. Then, select **Open** to add the file to the project.

To add the AIO3315.bas file to your project in Visual Basic 5.0 and 6.0, go to the **Project** menu and select **Add Module**. Click on the Existing tab page. **Select** AIO3315.bas, which is in the AIO3315 \ api directory. Then, select **Open** to add the file to the project.

9.3.3 Borland C++ builder

To use Borland C++ builder as development tool, you should generate a .lib file from the .dll file by implib.exe.

implib AIO3315BC.lib AIO3315.dll

Then add the **AIO3315BC.lib** to your project and add

#include "AIO3315.h" to main program.

Now you may use the dll functions in your program. For example, the Read Port function has the following format:

Status = AIO3315_port_read (u8 CardID, u8 port, u8*data);

where **CardID** and **port** are input parameters, and **data** is an output parameter. Consider the following example:

u8 CardID, port;

u8 data;

u32 Status;

Status = AIO3315_port_read (CardID, port, &data);

Initialization and close

● **AIO3315 initial**

Format : u32 status =AIO3315_initial (void)

Purpose: Initial the AIO3315 resource when start the Windows applications.

● **AIO3315 close**

Format : u32 status =AIO3315_close (void);

Purpose: Release the AIO3315 resource when close the Windows applications.

● **AIO3315 info**

Format : u32 status =AIO3315_info(u8 CardID, u8 *CardType, u16 *DIO_address, u16 *TC_address);

Purpose: Read the physical I/O address assigned by O.S.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW

Output:

Name	Type	Description
CardType	u8	0: AIO3315 (12 bit version) 1: AIO3315A (16 bit version)
DIO_address	u16	physical I/O address assigned to DIO block by OS
TC_address	u16	physical I/O address assigned to timer block by OS

DA BLOCK

● AIO3315 DA set

Format : u32 status = AIO3315_DA_set(u8 CardID,u8 channel, u16 data)

Purpose: DA output

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
channel	u8	0: DA0 channel 1: DA1 channel
data	u16	0~0xffff (AIO3315) 、 0~0xffff (AIO3315A) for analog output amplitude 0V ~ 10V 0V output is 0x7ff (AIO3315) 0x7fff (AIO3315A) -10V output is 0, 10V output is 0xffff (AIO3315) 0xffff (AIO3315A)

● AIO3315 DA read

Format : u32 status = AIO3315_DA_read(u8 CardID,u8 channel, u16 *data)

Purpose: read back DA setting data

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
channel	u8	0: DA0 channel 1: DA1 channel

Output:

Name	Type	Description
data	u16	0~0xffff (AIO3315) 、 0~0xffff (AIO3315A) for analog output -10V ~ 10V 0V output is 0x7ff (AIO3315) 0x7fff (AIO3315A) -10V output is 0, 10V output is 0xffff (AIO3315) 0xffff (AIO3315A)

AD BLOCK

- AIO3315 AD config set**

Format : u32 status = AIO3315_AD_config_set (u8 CardID, u8 port, AD_config *AD_config)

Purpose: configure each channel as differential or single end.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x
AD_config	AD_config	<pre> struct _AD_config{ u8 ch01_config, u8 ch23_config, u8 ch45_config, u8 ch67_config } // ch01: AIx0~AIx1 // ch23: AIx2~AIx3 // ch45: AIx4~AIx5 // ch67: AIx6~AIx7 // chNM_config: //0: chNM is paired differential and polarity is normal //1: chNM is paired differential and polarity is inverse //2: invalid //3: chNM is single end For example, if you will configure channel 0,1 as differential with polarity normal, channel 2,3 as single end channel 4,5 , channel 6,7 as differential with inverse polarity then struct AD_config is {0,3,1,1} </pre>

- AIO3315 AD config read**

Format : u32 status = AIO3315_AD_config_read (u8 CardID, u8 port, AD_config*AD_config)

Purpose: read back configuration of each channel.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x

Output:

Name	Type	Description
AD_config	AD_config	struct _AD_config{ u8 ch01_config, u8 ch23_config, u8 ch45_config, u8 ch67_config }

- **AIO3315 AD range set**

Format : u32 status = AIO3315_AD_range_set(u8 CardID, u8 port, AD_range *AD_range)

Purpose: set up each group conversion range

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x
AD_range	AD_range	struct _AD_Range{ u8 ch0_range, u8 ch1_range, u8 ch2_range, u8 ch3_range u8 ch4_range, u8 ch5_range, u8 ch6_range, u8 ch7_range } // chN_range //0: +-5V //1: 0-5V //2: +-10V //3: 0-10V

Note:

If the even channel is configured as differential input, the next odd number channel member is invalid.

For example ch0 is configured as differential input by AIO3315_AD_config_set, then the AD_Range.ch1_range is of no use.

● **AIO3315 AD range read**

Format : u32 status = AIO3315_AD_range_read(u8 CardID, u8 port, AD_range *AD_range)

Purpose: read back each group conversion range setting

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x

Output:

Name	Type	Description
data	U32	struct _AD_Range{ u8 ch0_range, u8 ch1_range, u8 ch2_range, u8 ch3_range, u8 ch4_range, u8 ch5_range, u8 ch6_range, u8 ch7_range } // chN_range //0: +-5V //1: 0-5V //2: +-10V //3: 0-10V

● **AIO3315 AD start**

Format : u32 status = AIO3315_AD_start(u8 CardID,u8 port,u8 channel)

Purpose: start AD conversion of designated port and channel

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x
channel	u8	0~7, channel no for portN

● **AIO3315 AD read**

Format : u32 status = AIO3315_AD_read(u8 CardID,u8 port,u16 *data)

Purpose: read AD conversion data of previous designated port and channel

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
port	u8	0: port0, AD0x 1: port1, AD1x 2: port2, AD2x 3: port3, AD3x

Output:

Name	Type	Description
data	u16	0~0xfff (AIO3315), 0~0xffff (AIO3315A). AD converted data

Note:

1. **AIO3315_AD_start** will select the port and channel for the next AD operation.
2. Before read back the data by **AIO3315_AD_read**, you must check the status by **AIO3315_IRQ_status_read** (no matter you use interrupt or not) to confirm the AD data is ready.
3. The AD conversion time frame is as follows:

At the same time frame, the command start the designated AD channel and collect the converted data. In order to confirm the operation is complete, we suggest to use **AIO3315_IRQ_status_read** to verify the completeness of conversion then use **AIO3315_AD_read** to read the converted data.

I/O Port R/W

● AIO3315 port config set

Format : u32 status =AIO3315_port_config_set (u8 CardID, u8 port, u8 configuration)

Purpose: Sets port configuration.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1
configuration	u8	b0: 0: port0 as input port (default) 1: port0 as output port b1: 0: port1 as input port (default) 1: port1 as output port

● AIO3315 port config read

Format : u32 status =AIO3315_port_config_read (u8 CardID, u8 port,u8 *configuration)

Purpose: read port configuration.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1

Output:

Name	Type	Description
configuration	u8	b0: 0: port0 as input port (default) 1: port0 as output port b1: 0: port1 as input port (default) 1: port1 as output port

- AIO3315 debounce time set**

Format : u32 status = AIO3315_debounce_time_set (u8 CardID,u8 port ,u8 debounce_time)

Purpose: set the input port debounce time

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1
debounce_time	u8	Debounce time selection: 0: no debounce 1: filter out duration less than 10ms (default) 2: filter out duration less than 5ms 3: filter out duration less than 1ms

Note: only valid for port configured as input

- AIO3315 debounce time read**

Format : u32 status = AIO3315_debounce_time_read (u8 CardID,u8 port , u8 *debounce_time)

Purpose: To read back configuration of debounce mode

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1

Output:

Name	Type	Description
debounce_time	u8	Debounce time selection: 0: no debounce 1: filter out duration less than 10ms (default) 2: filter out duration less than 5ms 3: filter out duration less than 1ms

- **AIO3315 port set**

Format : u32 status = AIO3315_port_set (u8 CardID,u8 port, u8 data)

Purpose: Sets the output data.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1
data	u8	bitmap of output values If port is configured as input, the data is registered and do not output. If port is configured as output, the data is registered and output.

Note: If you change the configuration from input to output, the previous registered data will be output.

- **AIO3315 port read**

Format : u32 status = AIO3315_port_read (u8 CardID , u8 port , u8 *data)

Purpose: Read the register or input values of the I/O port.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1

Output:

Name	Type	Description
data	u8	I/O data If port is configured as input, the data is external input data. If port is configured as output, the data is the output register data.

- **AIO3315 point set**

Format : u32 status =AIO3315_point_set (u8 CardID, u8 port, u8 point, u8 state)

Purpose: Sets the bit data of output port.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1
point	u8	point number 0~7 for bit0~bit7
state	u8	state of output point If port is configured as input, the data is registered and do not output. If port is configured as output, the data is registered and output.

Note: If you change the configuration from input to output, the previous registered data will be output.

- **AIO3315 point read**

Format : u32 status =AIO3315_point_read (u8 CardID, u8 port, u8 point, u8 *state)

Purpose: Read the state of the input points or output register.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
port	u8	port number 0: port0 1: port1
point	u8	point number of input 0~7 for bit0~bit7

Output:

Name	Type	Description
state	u8	state of point of input If port is configured as input, the data is external input data. If port is configured as output, the data is the output register data.

Timer function

● AIO3315 timer set

Format : u32 status = AIO3315_timer_set (u8 CardID,u32 Timer_constant)

Purpose: set time constant.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
Timer_constant	u32	Timer_constant based on 1us time base

Note:

1. Time constant is based on 1us clock, period $T = (\text{time_constant} + 1) * 1\text{us}$
2. If you also enable the timer interrupt, the period T must at least larger than the system interrupt response time else the system will be hanged by excess interrupts.

● AIO3315 timer read

Format : u32 status = AIO3315_timer_read (u8 CardID, u32 * Timer_constant)

Purpose: To read timer value on the fly

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW

Output:

Name	Type	Description
Timer_constant	u32	timer value on the fly

● AIO3315 timer start

Format : u32 status = AIO3315_timer_start (u8 CardID)

Purpose: start timer function.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW

● **AIO3315 timer stop**

Format : u32 status = AIO3315_timer_stop (u8 CardID)

Purpose: stop timer function.

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW

● **AIO3315 TC set**

Format : u32 status= AIO3315_TC_set (u8 CardID,u8 index,u32 data)

Purpose: To load data to timer related registers

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
index	u8	0: TC_CONTROL 1: PRELOAD 2: TIMER
data	u32	For index = TC_CONTROL 0: stop timer operation 1: timer run For index = PRELOAD or TIMER Data is the constant to be load

Note : PRELOAD is the register for timer to re-load, the value will be valid while timer count to zero and reload the data.

● **AIO3315 TC read**

Format : u32 status= AIO3315_TC_read (u8 CardID,u8 index,u32 *data)

Purpose: To read data from timer related registers

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by DIP/ROTARY SW
index	u8	0: TC_CONTROL 1: PRELOAD 2: TIMER

Output:

Name	Type	Description
data	u32	Data read back

Interrupt function

● AIO3315 IRQ polarity set

Format : u32 status = AIO3315_IRQ_polarity_set (u8 CardID, u8 polarity)

Purpose: Sets the IRQ polarity of port0 (IO00~IO07)

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
polarity	u8	Data to be set, 0x0 ~ 0xff bit0: IO00 0:normal (default) 1:invert ... bit7: IO07 0:normal (default) 1:invert

Note: Port0 must configured as input port for IO00~IO07 IRQ function.

● AIO3315 IRQ polarity read

Format : u32 status = AIO3315_IRQ_polarity_read (u8 CardID, u8 *polarity)

Purpose: Read the IRQ polarity of the IO00~IO07

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW

Output:

Name	Type	Description
polarity	u8	Data to be set, 0x0 ~ 0xff bit0: IO00 0:normal (default) 1:invert ... bit7: IO07 0:normal (default) 1:invert

● **AIO3315 IRQ mask set**

Format : u32 status = AIO3315_IRQ_mask_set (u8 CardID,u8 source, u8 mask)

Purpose: Mask interrupt from port0 IO07~IO00 or timer

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
source	u8	0:digital I/O block 1: AD block 2: timer block
mask	u8	Digital IO block: b0=0, IO00 input disable irq b0=1, IO00 input can generate irq ... b7=0, IO07 input disable irq b7=1, IO07input can generate irq AD block: b0=1 means AD0 end of conversion can generate interrupt b0=0 AD0 will not generate interrupt while end of conversion b1=1 means AD1 end of conversion can generate interrupt b1=0 AD1 will not generate interrupt while end of conversion b2=1 means AD2 end of conversion can generate interrupt b2=0 AD2 will not generate interrupt while end of conversion b3=1 means AD3 end of conversion can generate interrupt b3=0 AD3 will not generate interrupt while end of conversion Timer block: b0=1 means timer count up can generate interrupt b0=0 timer will not generate interrupt while time up

● **AIO3315 IRQ mask read**

Format : u32 status = AIO3315_IRQ_mask_read (u8 CardID,u8 source,u8 *mask)

Purpose: read back interrupt Mask of IO07~IO00 or ADC or timer

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
source	u8	0:digital I/O block 1: AD block 2: timer block

Output:

Name	Type	Description
mask	u8	<p>Digital IO block: b0=0, IO00 input disable irq b0=1, IO00 input can generate irq ... b7=0, IO07 input disable irq b7=1, IO07input can generate irq</p> <p>AD block: b0=1 means AD0 end of conversion can generate interrupt b0=0 AD0 will not generate interrupt while end of conversion b1=1 means AD1 end of conversion can generate interrupt b1=0 AD1 will not generate interrupt while end of conversion b2=1 means AD2 end of conversion can generate interrupt b2=0 AD2 will not generate interrupt while end of conversion b3=1 means AD3 end of conversion can generate interrupt b3=0 AD3 will not generate interrupt while end of conversion</p> <p>Timer block: b0=1 means timer count up can generate interrupt b0=0 timer will not generate interrupt while time up</p>

● **AIO3315 IRQ process link**

Format : u32 status = AIO3315_IRQ_process_link (u8 CardID,
void (__stdcall *callbackAddr)(u8 CardID))

Purpose: Link irq service routine to driver

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
callbackAddr	void	callback address of service routine

● **AIO3315 IRQ enable**

Format : u32 status = AIO3315_IRQ_enable (u8 CardID, HANDLE *phEvent)

Purpose: Enable interrupt from selected source

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW

Output:

Name	Type	Description
phEvent	HANDLE	event handle

● **AIO3315 IRQ disable**

Format : u32 status = AIO3315_IRQ_disable (u8 CardID)

Purpose: Disable interrupt from selected source

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW

● **AIO3315 IRQ status read**

Format : u32 status = AIO3315_IRQ_status_read (u8 CardID,u8 source, u8 *Event_Status)

Purpose: To read back the interrupt status to identify the source

Parameters:

Input:

Name	Type	Description
CardID	u8	assigned by Rotary SW
source	u8	0:digital I/O block 1: AD block 2: timer block

Output:

Name	Type	Description
Event_Status	u8	Digital IO block: b0=1, IO00 input generate irq ... b7=1, IO07 input generate irq AD block: b0=1, AD0 end of conversion and data is ready b0=0, AD0 is under conversion b1=1, AD1 end of conversion and data is ready b1=0, AD1 is under conversion b2=1, AD2 end of conversion and data is ready b2=0, AD2 is under conversion b3=1, AD3 end of conversion and data is ready b3=0, AD3 is under conversion Timer block: b0=1 means timer count up occurred. b0=0 means timer not count up.

Note:

1. Status read back will also clear the on board status register.
2. The status will reflect the on board digital input or timer count up status are irrelevant to the IRQ_MASK

9.5 Dll list

	Function Name	Descriptive Name
1	AIO3315_initial()	AIO3315 Initial
2	AIO3315_close()	AIO3315 Close
3	AIO3315_info()	get OS. Assigned address
4	AIO3315_DA_set()	DA output
5	AIO3315_DA_read()	read back DA setting data
6	AIO3315_AD_config_set()	configure each channel as differential or single end
7	AIO3315_AD_config_read()	read back configuration of each channel
8	AIO3315_AD_range_set()	set up each group conversion range
9	AIO3315_AD_range_read()	Read back each group conversion range setting
10	AIO3315_AD_start()	start AD conversion of designated channel
11	AIO3315_AD_read()	read AD conversion data
12	AIO3315_port_config_set()	Port direction configuration
13	AIO3315_port_config_read()	Read back port configuration
14	AIO3315_debounce_time_set()	Set input port debounce time
15	AIO3315_debounce_time_read()	Read back input port debounce time
16	AIO3315_port_set()	Set Output port
17	AIO3315_port_read()	Read the register or input values of the I/O port
18	AIO3315_point_set()	Set the bit data of output port
19	AIO3315_point_read()	Read the state of the input points or output register
20	AIO3315_timer_set()	Set timer constant
21	AIO3315_timer_read()	Read timer on the fly
22	AIO3315_timer_start()	Start timer operation
23	AIO3315_timer_stop()	Stop timer operation
24	AIO3315_TC_set()	load data to timer related registers
25	AIO3315_TC_read()	Read back data of timer related registers
26	AIO3315_IRQ_polarity_set()	Sets the IRQ polarity of port0
27	AIO3315_IRQ_polarity_read()	Read back the setting of IRQ polarity
28	AIO3315_IRQ_mask_set()	Mask off the IRQ
29	AIO3315_IRQ_mask_read()	Read back the mask
30	AIO3315_IRQ_process_link()	Link irq service routine
31	AIO3315_IRQ_enable()	Enable interrupt function
32	AIO3315_IRQ_disable()	Disable interrupt function
33	AIO3315_IRQ_status_read()	Read back the IRQ status

10. AIO3315 Error codes table

Error Code	Symbolic Name	Description
0	DRV_NO_ERROR	No error.
1	DRV_READ_DATA_ERROR	Read data error
2	DRV_INIT_ERROR	Driver initial error
100	DEVICE_IO_ERROR	Device Read/Write error
101	DRV_NO_CARD	No AIO3315 card on the system.
102	DRV_DUPLICATE_ID	AIO3315 CardID duplicate error.
103	DRV_NOT_INSTALL	AIO3315 driver not installed completely
300	ID_ERROR	Function input parameter error. CardID setting error, CardID doesn't match the DIP SW setting
301	PORT_ERROR	Function input parameter error. Parameter out of range.
302	POINT_ERROR	Function input parameter error. Parameter out of range.
303	DATA_ERROR	Function input parameter error. Parameter out of range.
304	CONFIGURATION_ERROR	Hardware version can not match with software version
305	DEBOUNCE_TIME_ERROR	Debounce timer setting error
400	INDEX_ERROR	TC register index error
401	CONSTANT_ERROR	Time constant error
402	TC_CONTROL_ERROR	TC control register setting error
500	DA_DATA_ERROR	DA setting data error
501	DA_CHANNEL_ERROR	DA channel selection error
600	AD_PORT_ERROR	AD port selection error
601	AD_CHANNEL_ERROR	AD channel selection error
602	AD_CONFIG_ERROR	AD channel configuration error
603	AD_RANGE_ERROR	AD range setting error
700	SOURCE_ERROR	IRQ source error
701	POLARITY_ERROR	IRQ polarity error
702	MASK_ERROR	IRQ mask error
